Reference; FCC Formal complaint and comment regarding ET Docket No. 03-137 and ET Docket No. 13-84

Subject; Request an investigation into the over exposure to radio frequency, microwave, electrical distribution pollution as well as ground currents.

Dear FCC,

I would like to give you some information I have experienced regarding over exposure to radio frequency, microwave, electrical pollution in general as well as ground currents aka "stray voltage" caused by the electrical distribution system.

My background is many years of experience personally working in many electrically related fields. I have done everything from building radio and electronic kits as a boy, electrical drafting, to wiring homes with master electricians, wiring electrical panels for the automotive industry, working for wire and terminal suppliers and more recently helping people with power line pollution and ground current problems most master electricians could not solve. I am the third generation of a family who has worked with electricity. My Grand Father Eric Broser was one of about 5 people in the world who could wire the windings in a dynamo and keep the wiring perfectly balance. My Father was an engineer and we have all done wiring all of our lives. We as a family have all know the benefits as well as dangers of electricity and electromagnetic fields.

The least understood and known facts of electricity, radio frequencies and electromagnetic fields (EMFs) is the biological effects. There are many excellent studies done to date which prove non-ionizing EMFs have many negative effects on health at much lower non-ionizing levels than those currently considered safe by the FCC. These abundant current studies need to be considered when setting updated guidelines to protect everyone. Unfortunately the proliferation of electrical devices and technology by industry has drowned out the voices of many highly credentialed responsible researchers like Donald Zipze, Dr. George Carlo, Cindy Sage, Dr. Martin Graham, Martin Blank, Dave Stetzer, Dr. Magda Havis, Donald Hillman and many many more.

It is the FCCs duty and responsibility to consider all of the latest research which can result in making responsible adjustments to the guidelines that impact everyones health and well being and those of future generations who do not yet have a voice!

From my perspective of experience for the past three generations, the FCC needs to honor the oath and responsibility that all governmental agencies are charged with, to protect the the American people who have put their trust in their service to the Republic. It is high time to consider the wealth of all responsible research from all concerned researchers instead of selectively only adopting the research of corporate interests.

Sincerely,  
Philip R. Broser
